

Intelligent Cameras for Business Usage

Count.Camera

We count for you!

Count.Camera automatically recognizes and counts objects.

Using artificial intelligence (AI) images are analyzed and products can be recognized. After the installation of cameras at strategic places our algorithms take over the work and send you regularly precise and traceable data. Thus you can for example keep track of inventory without the need for human resources.

Application: Gatekeeper

Whether an airlock, a door or a table: We keep an eye on it and count what goes in or out. That way we can get a lot of information out of a few cameras. In the image below we have a check-in / check-out table. Spread your items, press the check-in button and it is immediately counted and booked into your system.

The limited field of view also ensures confidentiality of your items.

Application: Stock Monitoring

The camera is placed in front of a shelf or over a drawer and notices motion. After each movement the objects are counted. This avoids on one hand that people are recorded and allows on the other hand a real-time tracking of your inventory. We update your numbers every time someone passes by the shelf.

We can also detect fill levels as we do at this client's stock of detergents.

We gladly advise you regarding:

- Testing on site with no strings attached
- Evaluation of customer-specific applications
